

PACKAGING CONTAINER WITH INTEGRATED SHEET FOR RETENTION OF
PACKAGED ARTICLE

ABSTRACT OF THE DISCLOSURE

The invention provides a packaging container comprising a box adjustable between an open configuration and a closed configuration; the box comprising a plurality of side panels and a bottom arranged to define a storage compartment and an opening, the storage compartment being accessible through the opening when the box is in the open configuration. A first flap and a second flap form a first pair of opposing flaps, each of the first and second flaps being attached to a corresponding side panel and adapted for folding across at least a portion of the opening when the box is in the closed configuration. The box includes a second pair of opposing flaps, each flap of the second pair of opposing flaps being attached to a corresponding side panel and adapted for folding across at least a portion of the opening when the box is in the closed configuration. A sheet is provided, having a first end affixed to the first flap and a second end affixed to the second flap, wherein when the box is in the closed configuration, a first portion of the sheet is within the storage compartment, a second portion of the sheet is between the first flap and at least one flap of the second pair of opposing flaps, and a third portion of the sheet is between the second flap and at least one flap of the second pair of opposing flaps.
